## Project Summary

This project demonstrates how to initialize the following database model using only java class files and JPA metadata tags.

Design Development Insights

In general, I found this approach to database creation messy. However, the persistence capabilities were surprising. The idea of reducing inserts and deletion to simple collection manipulation was very powerful.
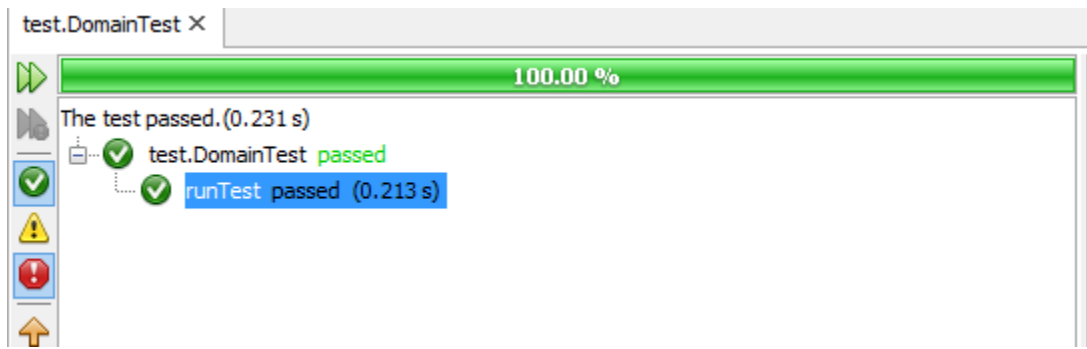

Requirements

To utilize (or run this) project—
    1) Verify that MySQL is up and running

2) In Netbeans, update the connection attributes of the persistence.xml
   file to point to an empty database configured on the local MySQL
   instance

3) In Netbeans, right click the Test Package > test > DomainTest class and
   select "Run File"

Screen Captures and Expected Results

When successfully, the DomainTest class should produce the following test
results.

```
[EL Info]: 2013-10-15 07:09:28.796--ServerSession(16724934)--EclipseLink, version: Eclipse Pe
[EL Info]: connection: 2013-10-15 07:09:29.04--ServerSession(16724934)--file:/C:/Users/Brady/
